

The Test

1. Technical problem

We have some customer records in a text file (customers.txt) -- one customer per line, JSON lines formatted. We want to invite any customer within 100km of our Dublin office for some food and drinks on us. Write a program that will read the full list of customers and output the names and user ids of matching customers (within 100km), sorted by User ID (ascending).

- You must use the first formula from [this Wikipedia article](#) to calculate distance. Don't forget, you'll need to convert degrees to radians.
- The GPS coordinates for our Dublin office are 53.339428, -6.257664.
- You can find the Customer list [here](#).

We're looking for you to produce working code, with enough room to demonstrate how to structure components in a small program. Good submissions are well composed. Calculating distances and reading from a file are separate concerns. Classes or functions have clearly defined responsibilities. Poor submissions will be in the form of one big function. It's impossible to test anything smaller than the entire operation of the program, including reading from the input file.

Here are some guidelines when approaching the submission:

- **Submit code as if you intended to ship it to production.**
- Use whatever language you feel strongest in. It doesn't have to be one we use.

Each submission must meet the following requirements:

- Submit your code via a service like Github, Gitlab, Bitbucket etc.
- Code must be tested.
- Please include the output of your program with your submission in a separate file, e.g., output.txt.

- A file explaining how to install, how to execute the code and how to run tests. We may not be familiar with the language/framework you used and this helps us to evaluate it.

2. Proudest Achievement

What's your proudest achievement? It can be a personal project or something you've worked on professionally. Just a short paragraph is fine, but I'd love to know why you're proud of it, what impact it had (If any) and any insights you took from it.

Here is our blog on [Take Home Test Assessment](#)
